

Changelog FW version 1.6.0 for XWEB PRO series

1. Main changes

1.1 New features

- The "Devices List" is now available in the backup section to create a comprehensive report with a list of devices and their serial settings in CSV format;
- The parameters backup function now displays a progress bar that increases as parameters are saved to the device.

1.2 Fixes

- Icons are not displayed on the emergency page;
- The function of importing a hybrid device from a pre-configuration loses the serial configuration;
- Error during the addition of devices with the hybrid library.
- Added control for the maximum length of the API v2 server path in /settings (up to 256 characters);
- *Add Device* button in Datapush stops working with an empty configuration;
- Creating custom descriptions for data-points in languages other than English;
- TXT report for Scheduler configuration when a global command has no selected data-points;
- RTC synchronization checkbox in device settings;
- Saving static route settings in Network Configuration when left empty;
- Password policy management when users are prompted to change their password;
- NTP time zone synchronization;
- Uploading circular charts for a device with some variables configured in high-frequency mode;
- Automatic device discovery via Modbus TCP/IP;
- Interface management with the removal of the "Connection Lost" message in some specific cases;
- Other minor fixes.
